Business registry no. 980.400.212.mva  
[www.duun.no](http://www.duun.no)

Fire wood processor VM420 has a 12 month guarantee against defects in materials and workmanship.

Parts that are not originally manufactured by Duun Industrier AS, for example shafts, bearings etc. are subject to these suppliers' guarantees and terms.

Parts that are considered to be wearing parts are not part of the basis of the guarantee - these have been specified in a separate survey on the bottom part of this page.

In cases where a repair is considered to be covered by the guarantee, the representative must inform the supplier's representatives that the repair is intended executed on the basis of the guarantee.

In this context, the following information must be recorded:

- Product name
- The product's serial no. (see the machine identification pp. 6 and 7)
- Date of sale
- The product owner's telephone no.
- Dealer with address, telephone no.

In case of such a repair, the supplier is presented with a claim within 3 weeks after the repair date.

Replaced parts are to be kept until a decision has been made with reference to the claim and the replaced parts are to be forwarded to Duun Industrier for assessment if so required.

As the employment of the product is beyond our control, we may only guarantee the quality and do not accept liability for the product's general performance.

The guarantee liability assumes that the prescribed maintenance has been carried out.

Duun Industrier reserves the right to modify the design and specifications and/or make alterations and improvements without notification.

### **What is not included by the guarantee**

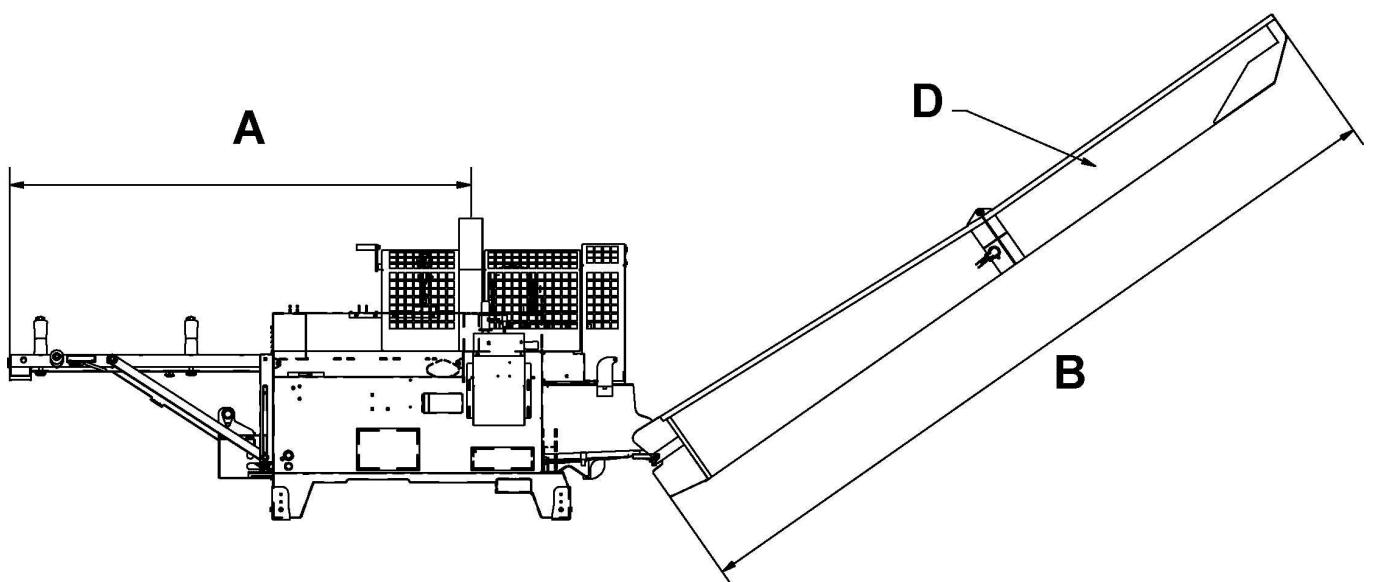

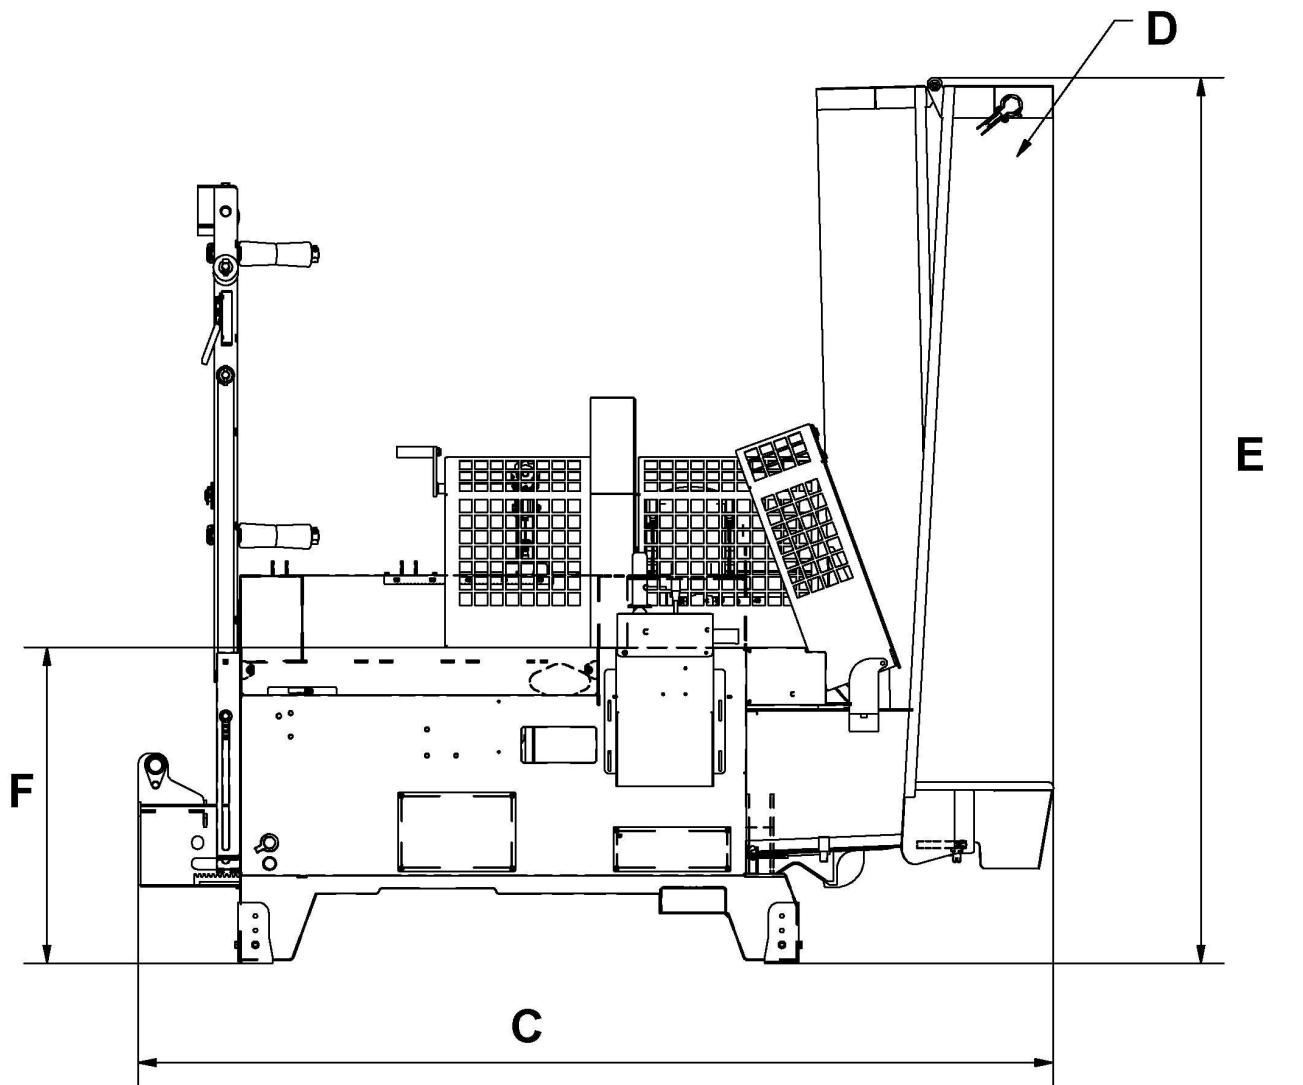

- The guarantee does not cover economic loss as a consequence of interruptions.
- The guarantee does not cover consequential loss due to defects.
- The guarantee does not cover defects or damage caused by misuse and use that is not in accordance with the instruction manual's specifications and guidelines.

### **The following parts and material are considered as wearing parts and are not covered by the guarantee:**

- The chain saw sword
- The saw chain
- The wood splitter knives
- The feeding conveyor
- Oil filter
- Hydraulic oil
- Filter cartridge for hydraulic oil

## Technical data

Properties	VM420
Net weight	875 kg
Length feeder conveyor A	2.200 mm
Length output conveyor-transporter B	4.000 mm
Sideways transporter + total	25 degrees to each side
Number of positions for transporter D	5 pcs
Total width during transport	2.550 mm
Height to work table max min F	880-960 mm
Total width assembled 30 degrees trans	6.850 mm
Depth seen from the side	1.280 mm
Velocity drive shaft	540 rpm
Connection with bolt fittings are standard	Yes
Total height ready for transport E	2,550 mm
Diameter ventilation fan	254 mm
Required power PTO 540 rpm max	31 kW
Number of oil pumps	3
Length of stroke wood splitting function	40 or 60 cm
Max cutting diameter logs	42 cm
Speed splitting cycle 40 cm wood	About 2 seconds at 8.5 tons
Splitting force max speed	5.5 tons
Splitting force at power drive (max power)	8.5 (11.0 tons)
Connection and de-connection of power drive	Automatic
Drive of saw chain	Hydraulic
Drive of input and output conveyor	Hydraulic
Saw chain lubrication capacity container	5 litres
Saw chain lubrication	Separate pump adjustable
Oil tank volume	78 litres
Splitting knife	6-splitter is standard
Hydraulic pressure	220 bar max splitting force 180 bar cutting circuit
<b>Accessories</b>	<b>Art. No.</b>
4-splitter knife	14120004
8-splitter knife	14120003
Power shaft Weasler L=860 4 piece	2962156
Remote control of input conveyor	141209020

All specifications are approximate values.

# **Machine identification**

The machine number and manufacturer is specified on the metal plate A

Make a note of the machine number and the time of delivery month-year on the space below.

Always indicate the machine number in case of inquiries regarding service.

The machine is CE-marked – see nameplate B. This confirms that the machine has an execution in accordance with EU's machine directive.

Machine number: .....

Delivery time,  
month/year: .....

## **Introduction**

We congratulate you on your purchase of the Duun fire wood processor VM420.

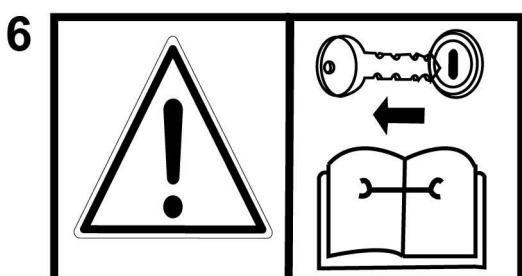

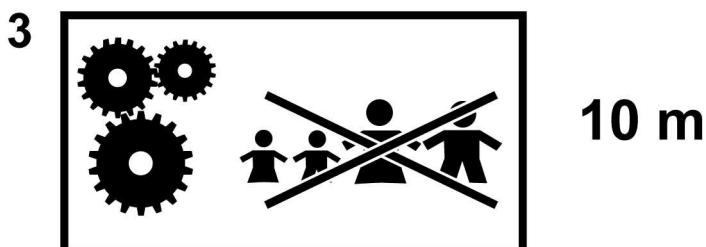

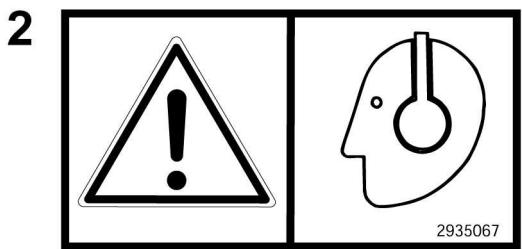

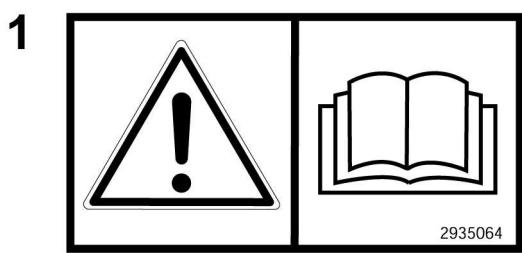

The product has a well developed service network for tractor driven machines. This provides safety for service and supply of spare parts and contributes to safe operations in demanding conditions.

All Duun tractor driven machines are constructed and tested in close cooperation with the users in order to produce well functioning and user friendly products.

In order to uphold the guarantees and that the machine is to function optimally during use, the indicated descriptions of maintenance and practical use of the machine must be followed.

Please read this manual before you start using the machine.

[www.duun.no](http://www.duun.no)

# Safety

## 1. Instruction manual

All operators, mechanics and the owner must be well acquainted with the instruction in this instruction manual before the machine is taken into use.

You should always work with care when you employ agricultural machinery. Read and observe the safety instructions in this binder. Your safety is your responsibility!

Be particularly aware of warning signs with this symbol it marks measures that must be carried out in order to avoid accidents. The symbol appears in the instruction manual and on warning signs on the machine.

## 2. Personal protection equipment

You should always wear hearing protection and protective goggles when using the wood machine. Further, you should use protective footwear and sturdy work gloves during handling of the machine and the materials.

## 3. The safety of the surroundings

Make sure that no-one not concerned are present in the area of work. We emphasize as strongly as possible that only one person is to handle the machine, i.e. operate the saw chain sword and the splitter. Nobody is to assist the main operator in the work area - risk of injury!

Never start the machine when there are people or animals close to the machine or the tractor.

Never stand between the tractor wheels and the machine!

The machine's rotating parts may cause severe injuries.

If other persons than the operator of the machine are present in the risk zone, the operator is to explain the danger the machine involves.

## 4. Clothing and the drive shaft

Do not work in clothing that may be caught in the moving parts of the machine (for example scarf, wide coats).

The tractor must be disconnected and the hand brake activated before the shaft is connected to the tractor's power take-off. The drive shafts are always to be equipped with original protection covers.

### **Damaged and worn covers are to be replaced immediately!**

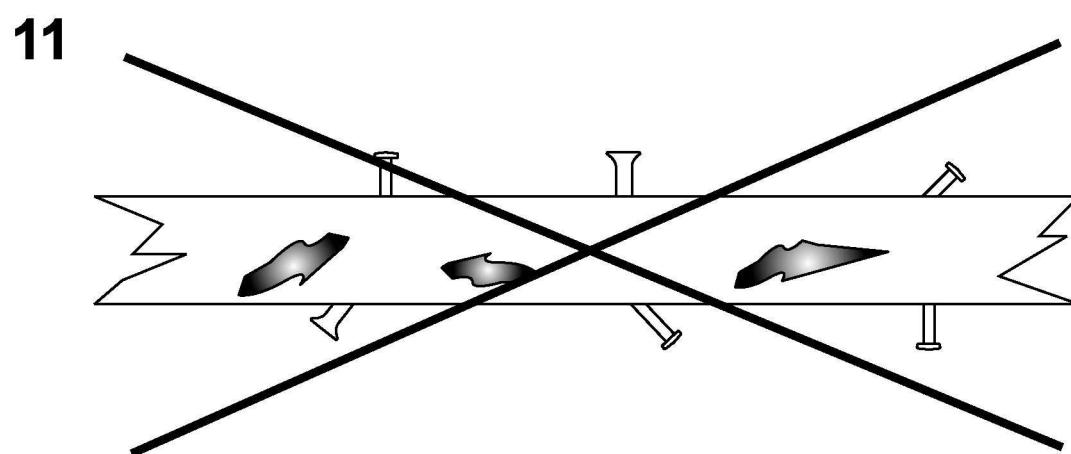

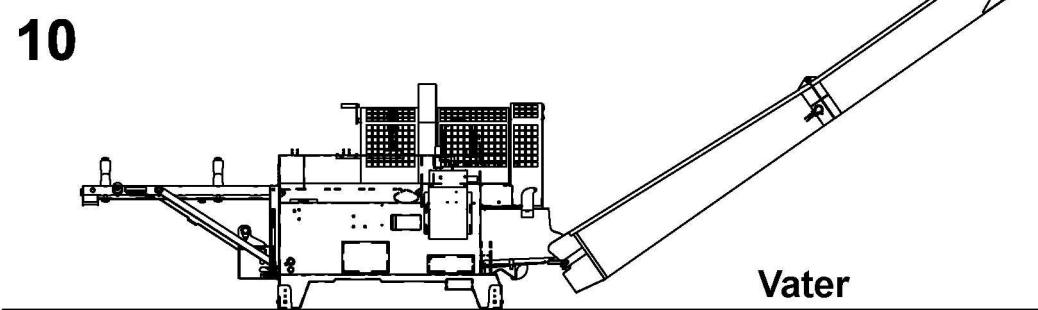

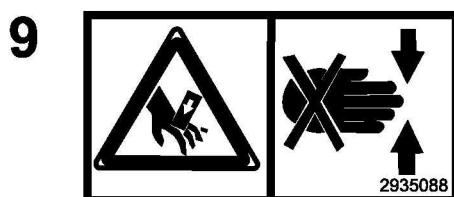

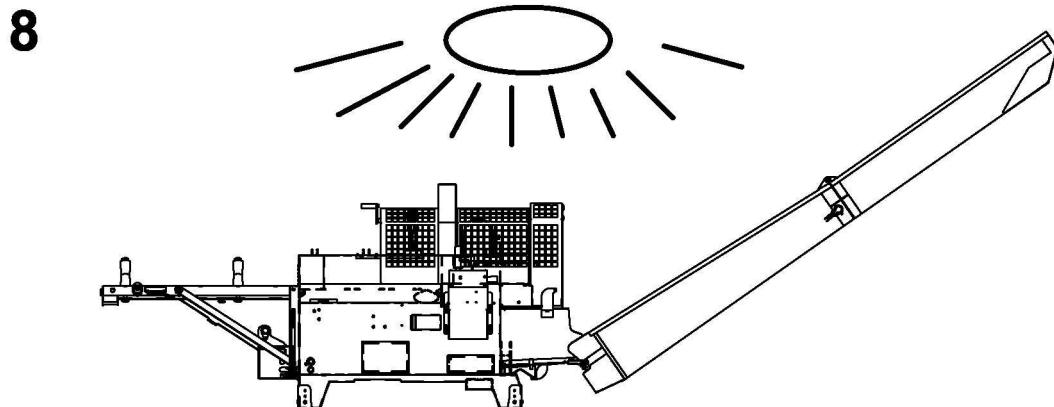

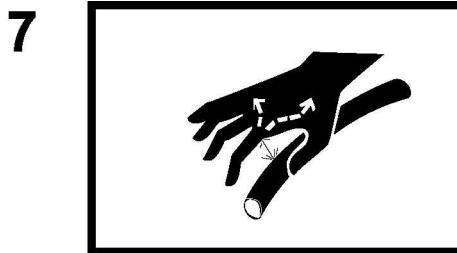

Make sure that all covers for the shaft are in good condition and correctly fitted. Never start the machine when this is not in order. The locking chains for the plastic covers are always to be fixed to the appropriate brackets in order to prevent the covers to rotate.

## 5 Safe connection and use.

Allow nobody to stay between the machine and tractor when the machine is connected to the tractor. The same applies during use of the machine. Make sure that the connection is carried out in a safe manner.

## 6. Safety in case of interruptions and maintenance.

Remember always to stop the tractor's engine and remove the ignition key before you lubricate, adjust, clean or carry out repairs. This is to secure that the tractor does not start before you have completed the operation.

## **7. Hydraulic high fluid pressure.**

Be careful when you work with hydraulics. Wear eye protection and gloves. Hydraulic oil under great pressure may penetrate the skin and cause serious infections. See a doctor if you have had an injury. Ensure that no-one is standing close by when hydraulic functions are performed.

## **8. Good lighting – a necessity.**

The machine must only be used in daylight that secures a good overview of the operations – or with artificial lighting which provides good overview of the work area.

Good lighting is very important with reference to safety.

## **9. Rotating parts – risk of crushing**

The machine's rotating parts may cause severe injuries. The same applies to risk of crushing during operation.

All covers and protective equipment is to be fitted on the machine during use. The user is responsible if an accident occurs as a consequence of defective protection.

Avoid all unnecessary stay in the working area when the machine is in operation.

**Never put your hand in behind the protective screen even if the saw chain is in back position.**

## **10. Horizontal positioning and tidiness on the workplace**

Always place the machine as horizontally and steady as possible to secure stable working conditions.

Keep the workplace as tidy as possible. This contributes to generally better safety against unwanted events.

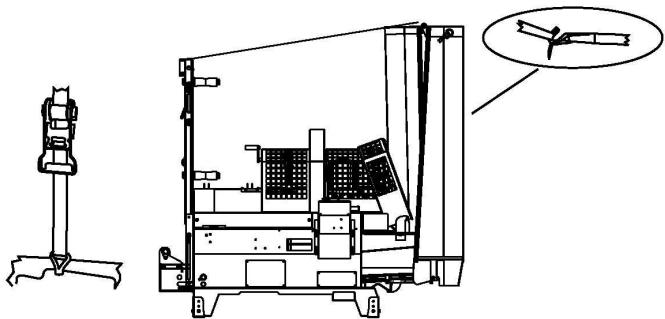

## **11. Area of application**

The machines are only intended for production of fire wood from "pure" wood material without any contaminants. It is not allowed to employ the machine for other material such as construction waste and similar with metal parts such as nails, screws and similar. The same applies for materials that are polluted with plaster and similar coatings. The saw chain is only designed for wood materials without contaminants.

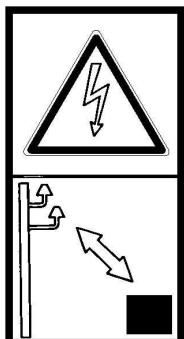

## **12. Zero alcohol tolerance**

Persons who are under the influence of drink or drugs must not operate the machine. The same applies to tired people who do not have full control over their movements.

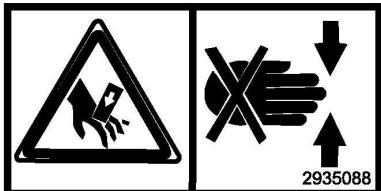

**13**

**14**

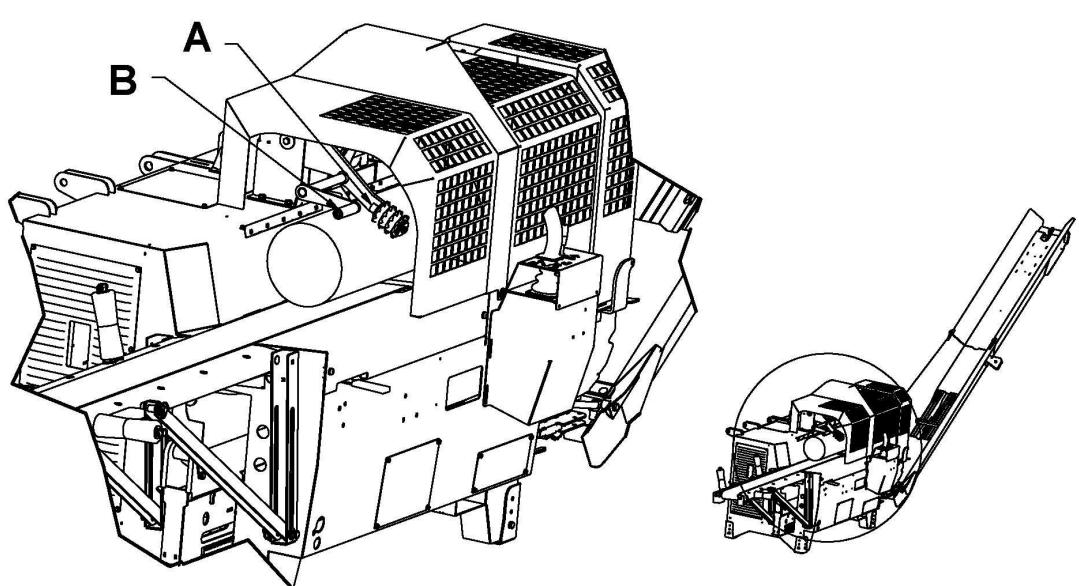

**15**

**16**

**17**

### **13. Safe transport**

Before the machine is moved, the feeder conveyor and transporter (both in an up-right position as outlined in the illustration) are to be strapped to secure that they do not fall down. The loading strap has a fixing point at the lower part of the feeding conveyor and secures the conveyor belt from falling off during transport.

### **14. Contact with electric wires and similar during transport.**

Be aware that the wood machine may be taller than the tractor during transport and there is a risk of contact with electric wires, railroad underpasses etc!

If the machine has been set up for splitting of 60cm wood lengths, it should be set back to 40cm before moving. This is because the machine will protrude on the right side if it transported in "60cm set-up". If you choose to move the machine in "60cm set-up", you should be very attentive of the fact that there is a protrusion beyond the width of the tractor on the right hand side.

### **15. Crushing risk – Rotating parts in the transporter**

Never put your hands or limbs into the output transporter. This part has rotating parts may cause severe injuries.

### **16. Transport conveyor - transporter**

Avoid staying under the transporter when this is under tension in order to avoid injuries in case of any uncontrolled downfall during use. Also avoid contact with the transporter's moving parts during use.

### **17. Safe cutting**

Avoid placing your hands close to the saw chain. This is obtained by consequently using the log holder A and the handle B to operate it.

For cutting the last log of wood, it is important to retain a "suitable" length and cut a shorter piece as the next to last. During this operation, it is especially important to use the hand operated log holder A so that the user does not receive an unexpected backlash from the final piece.

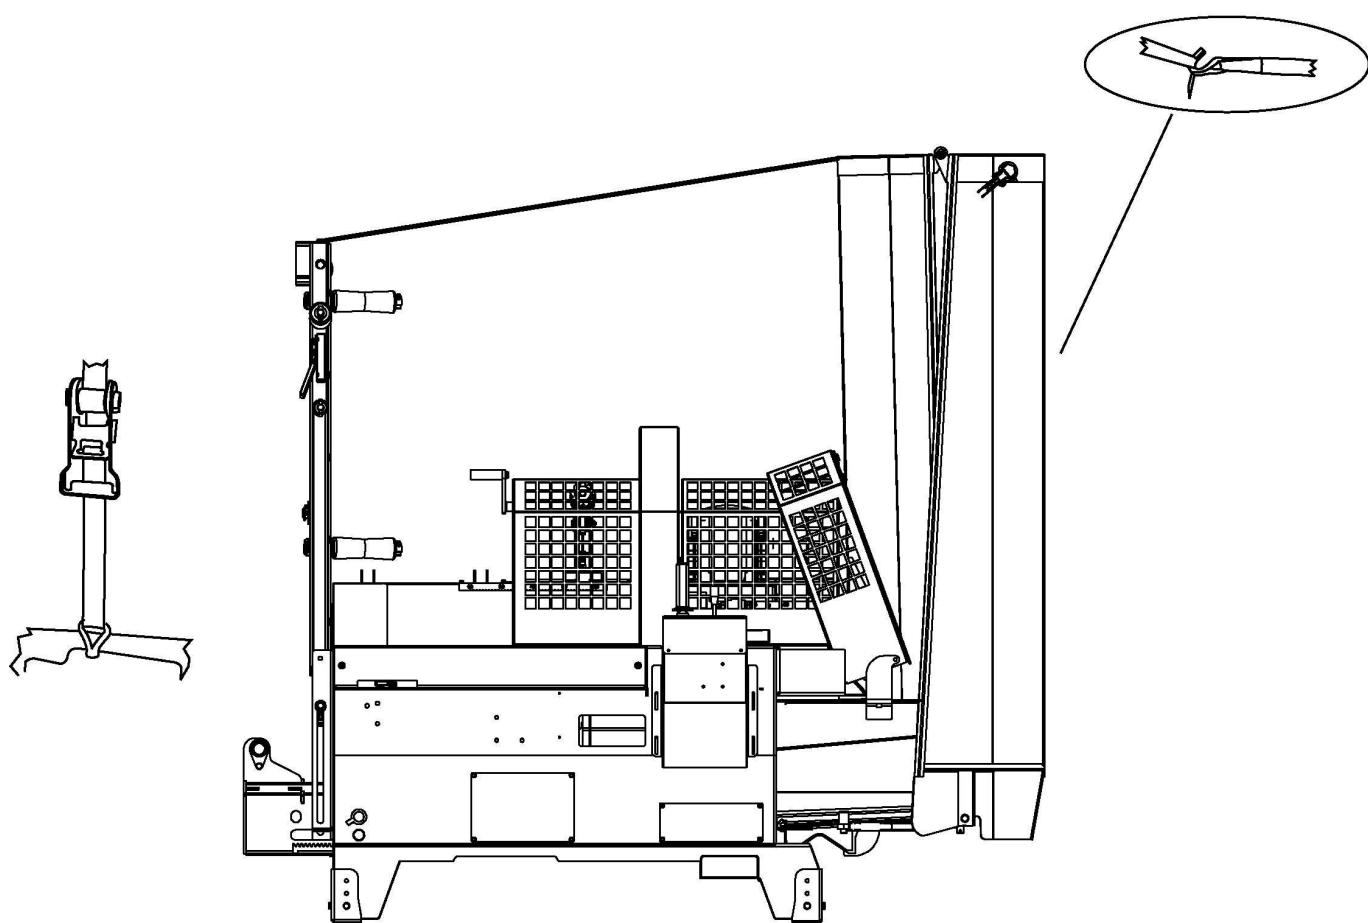

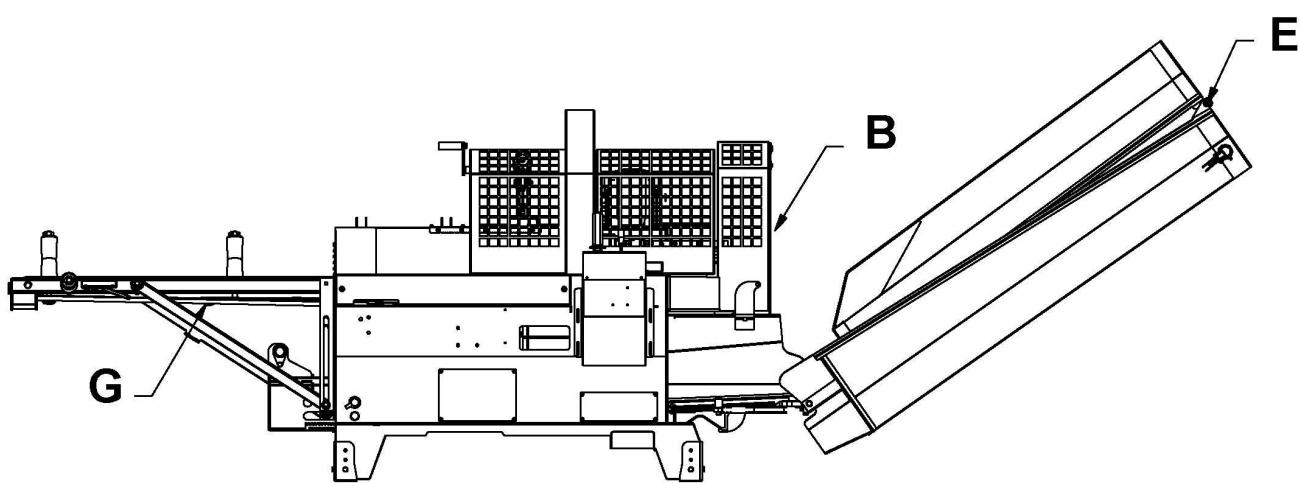

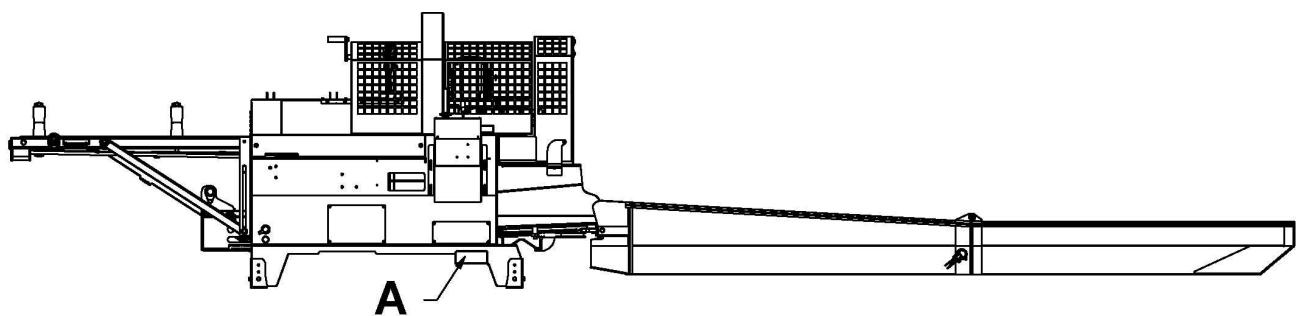

You are advised to use the "count-down ruler" for the last three lengths so that these may be cut to a somewhat shorter even length than the desired length.

When you want to cut twiggy or crooked logs, it is important to make sure that these are securely placed. Use the hand operated log holder A as much as possible during cutting of such wood materials to prevent that fingers/hands are squeezed.

Before start-up after maintenance you should check that all tools have been removed and brought back into place.

Before the machine is elevated or lowered, you should check that no-one is close to or touch the machine.

**If any warning signs are removed during repair or service, new signs must be fitted immediately!**

## **Transport and handling before use**

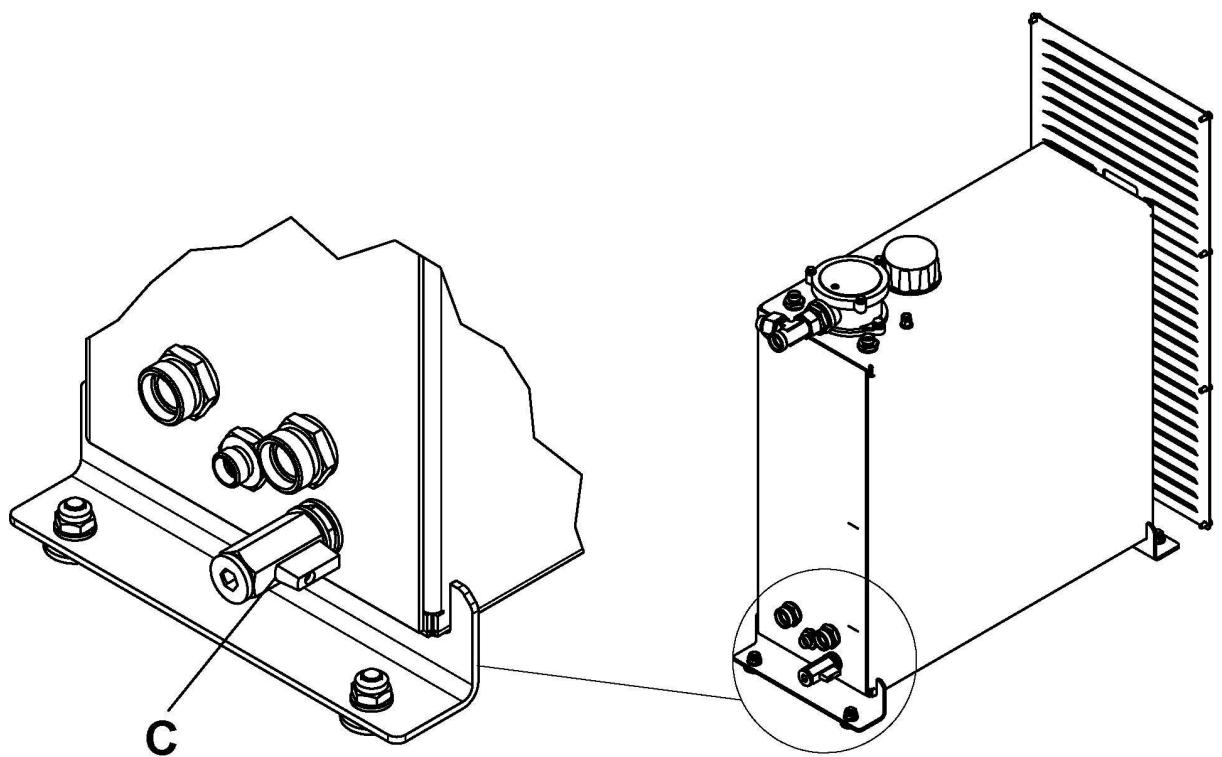

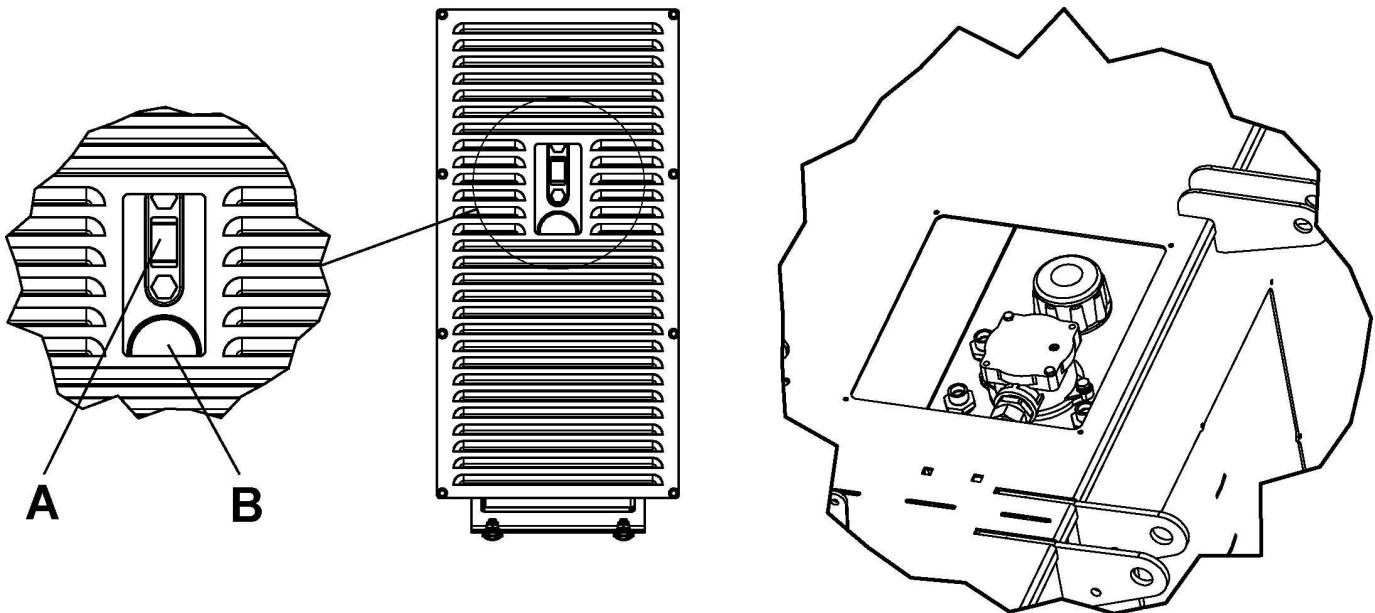

The VM420 body is equipped with a fork pocket (A) for handling with fork truck or pallet forks. Be aware that one individual wood machine weighs about 875 kg. Use lifting equipment designed for such total weight!

### **Preparation for moving with tractor.**

The transporter is folded together in the joint E. Afterwards, the transporter is moved to an upright position by means of the winch wire. During this process, the protection cover is shifted in point B Feeding table and the conveyor belt is adjusted to a vertical and horizontal position by releasing the locking pin in point G

### **Securing before moving**

Finally, the connection between the feeding table and the transporter should be secured by means of a strap for this purpose with fixing points as shown in the illustration. This is important to ensure that the feeding conveyor is kept in place during transport and the connection between the feeding table and the transporter is safely secured.

## **Preparations before use**

### **Hydraulic oil - quality.**

The machine's performance will, to a high degree, depend on keeping the hydraulic oil intact.

The greatest elements of risk for the quality of the oil are

- Excessively high temperature which entails poor lubrication performance and risk of faults and break-down of expensive components such as valves, pumps and motors.
- Condensation which is formed during conditions including humid air combined with temperature fluctuations. (the oil tank breathes through the filter and sucks in humid air)
- Condensation water in the oil has the same effect as excessively high oil temperature. Condensation appears mainly during use in conditions involving humid air and temperature around 0°C. The oil tank is equipped with a draining plug for changing oil and checks for condensation.

### **Oil level check.**

The machines are filled with 78 litres hydraulic oil from the factory. Recommended oil quality is ISO VG46 (viscosity group 46). Examples of such oils are Ambra Hydrosystem 46 HV, Mobil DTE15m, Statoil Hydraway HVXA46.

The oil level must be checked by observing the sight glass A which is fitted in the suction grille for the hydraulic oil tank.

### **Oil temperature check**

It is very important to keep track of the oil temperature B and avoid situations where it exceeds 70 degrees. This situation may occur during unfavourable operating conditions for example in case of too high rotational speed during use.

If the temperature exceeds 70 degrees, the machine must be stopped until a lower temperature has been "established".

If the machine has had excessively high hydraulic oil temperature, the oil must be changed.

**This is an unconditional requirement in the guarantee provisions.**

### **Condense check**

The oil tank is equipped with a drainage plug C in the bottom. Grey oil is an indication of water in the oil. In case the oil is polluted with water, all the hydraulic oil must be changed.

Beyond such conditions, the hydraulic oil must be changed every year or after 500 operating hours (whatever occurs first).

### **Drive shaft**

The requirement for the length of the drive shaft will vary in pace with the size of the tractor and the length of the steady-braces.

If there are operating angles from 25 degrees and upwards, you should employ a category 6 shaft to ensure long service life.

If there are great angles, it might be advantageous either to lower the tractor or elevating the machine. It may be elevated by means of the supporting legs which is standard equipment fitted in the corners and elevate the machine up to 80mm.

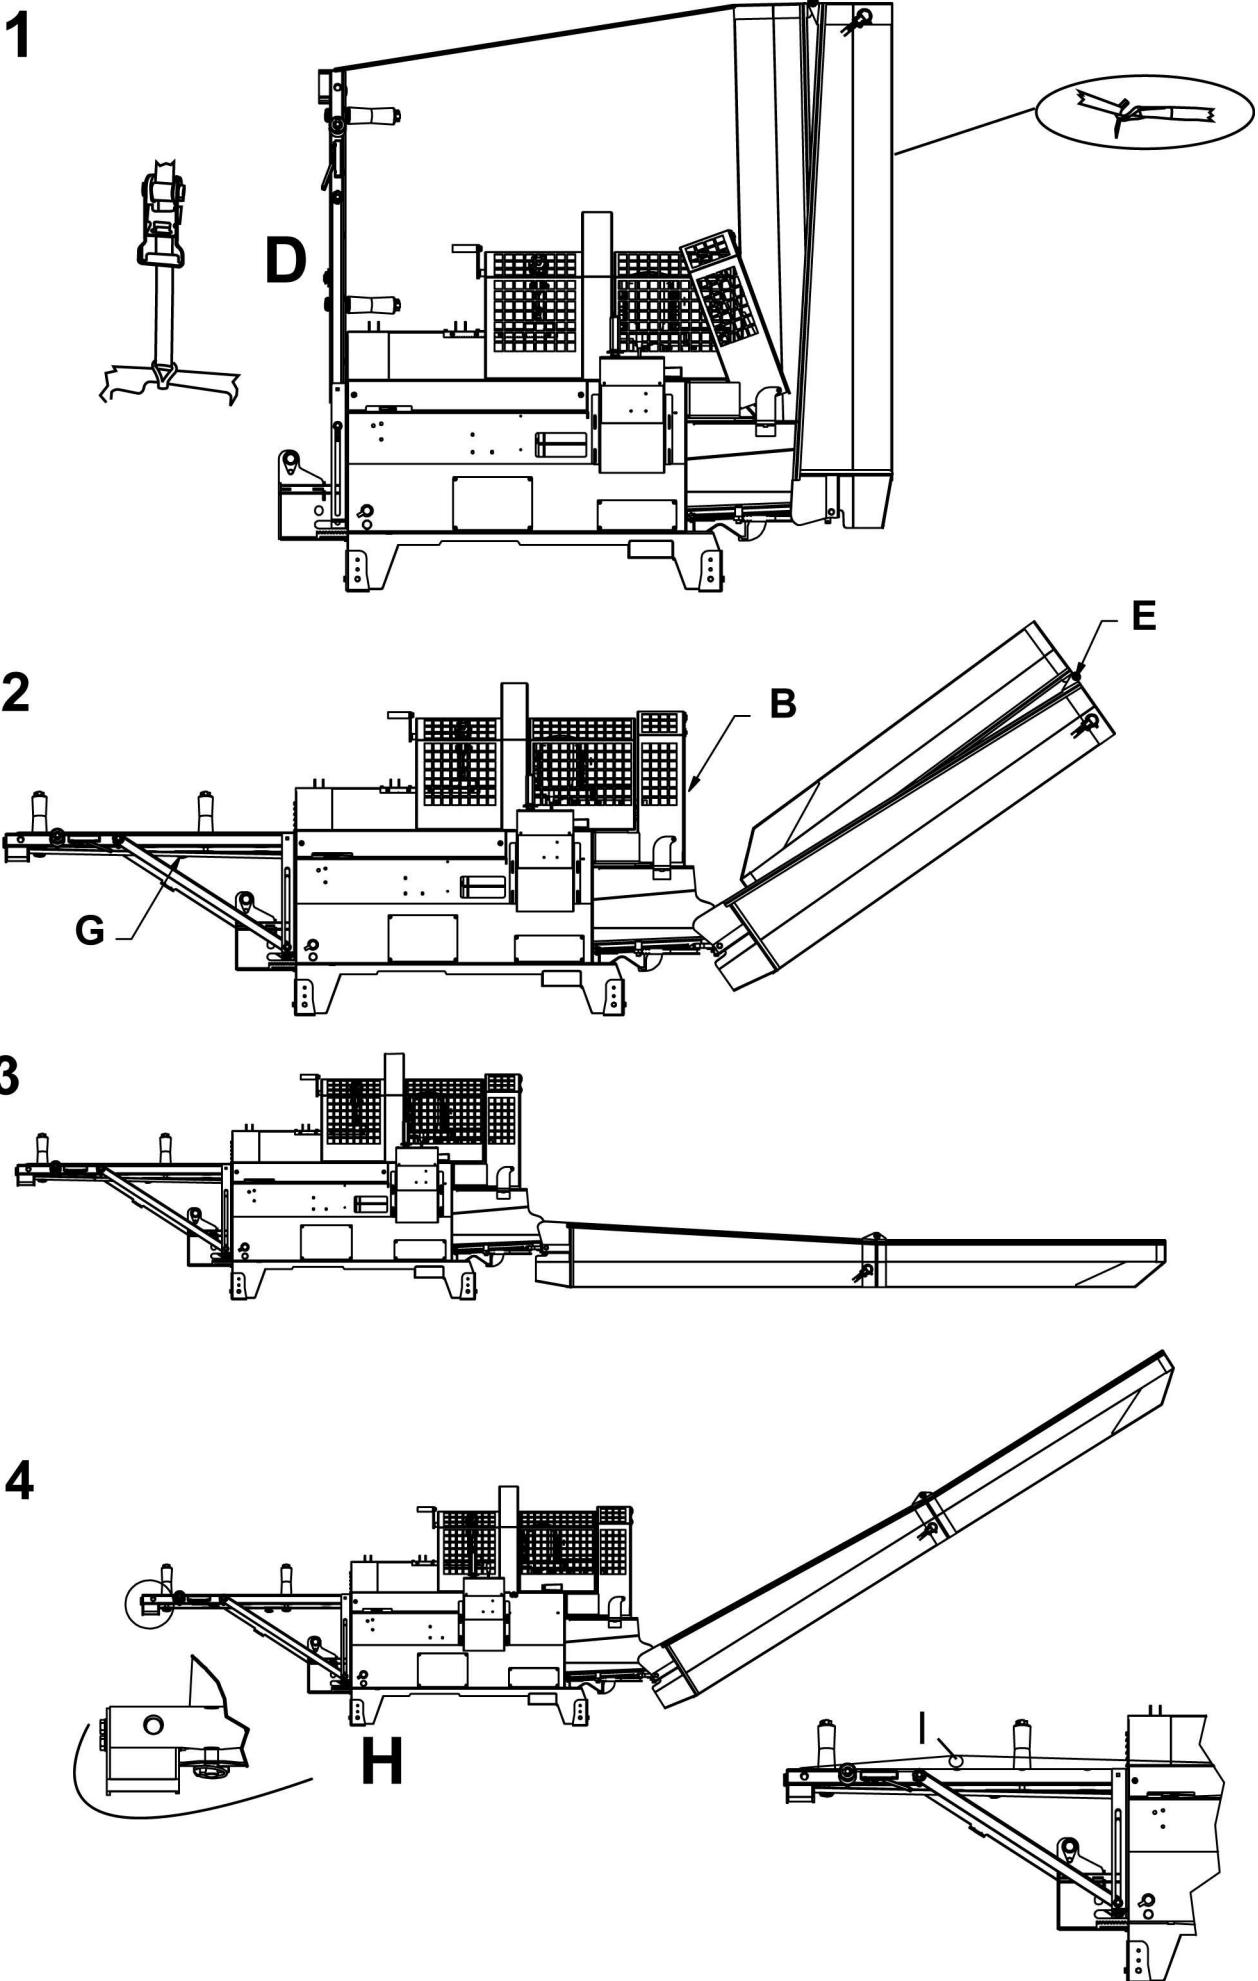

Ensure that the pto shaft had sufficient length. The profile tubes in the shaft are to, after any cutting, overlap by half the tube length. Any cutting of the shaft must be executed in accordance with the instructions for such operations – the cut must be trimmed for burrs both on the inside as well on the outside and the profile tubes should be well greased. Too short telescope length of the shaft entails a risk of overload of the tractor's power take-off and the gearbox of the VM420.

Please lubricate the PTO drive shaft before use.

The locking chains for the plastic covers are always to be fixed to the appropriate brackets in order to prevent the covers to rotate.

The drive shaft must be maintained and used in accordance with its instruction manual.

In order to obtain better operating angle, you may let the machine stand by itself and place the tractor at a distance and employ a longer drive shaft during operation.

## **Preparation of the transporter.**

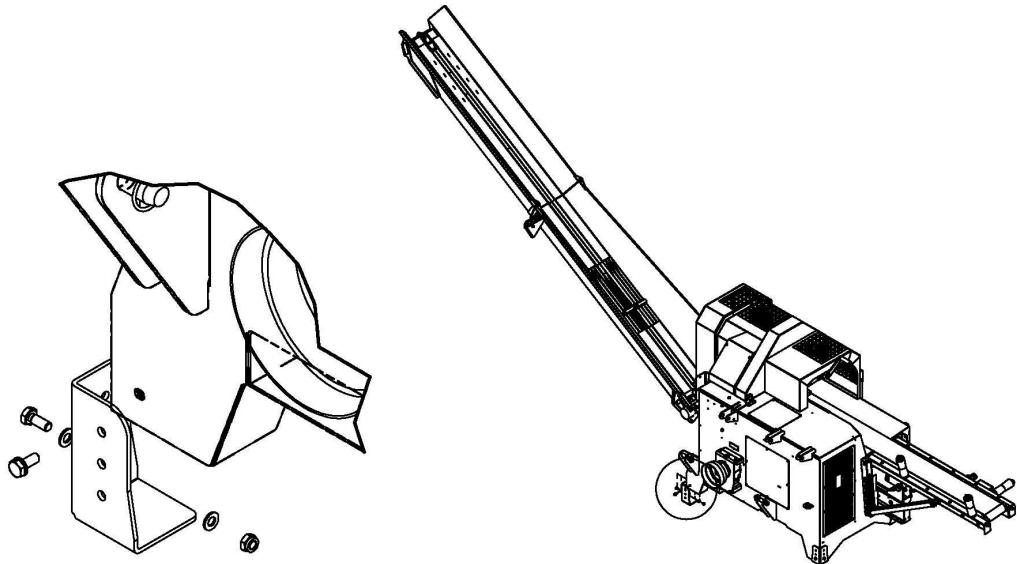

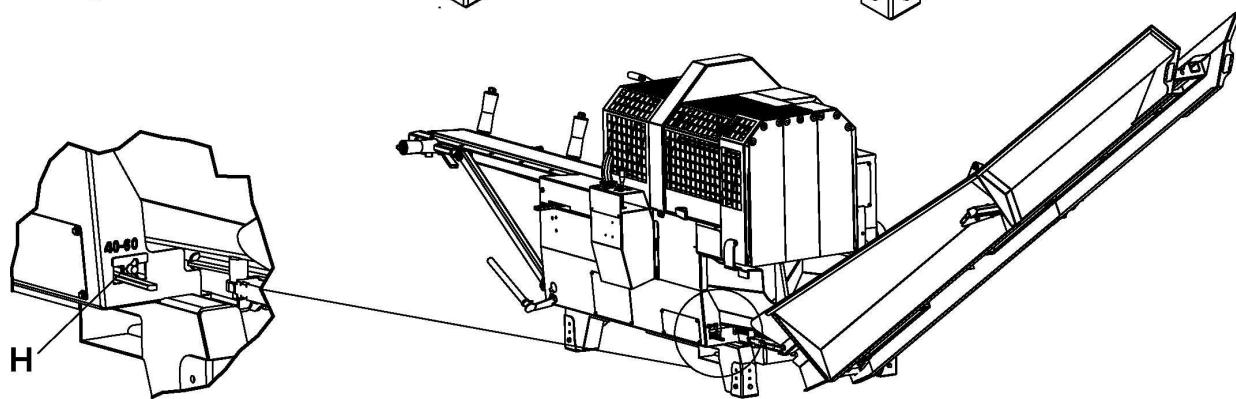

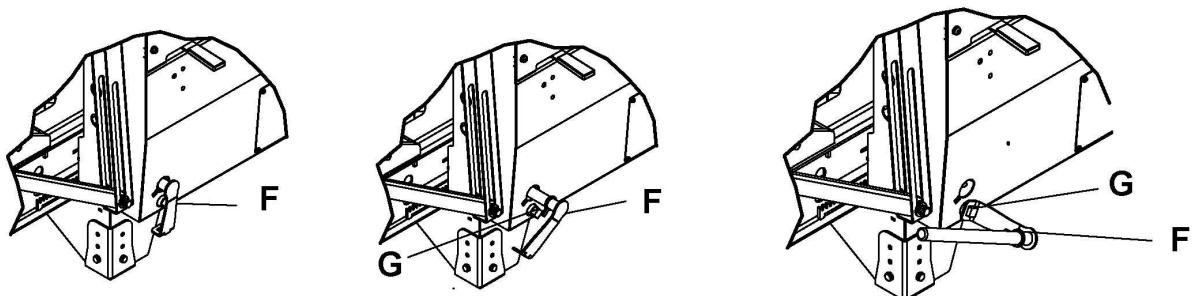

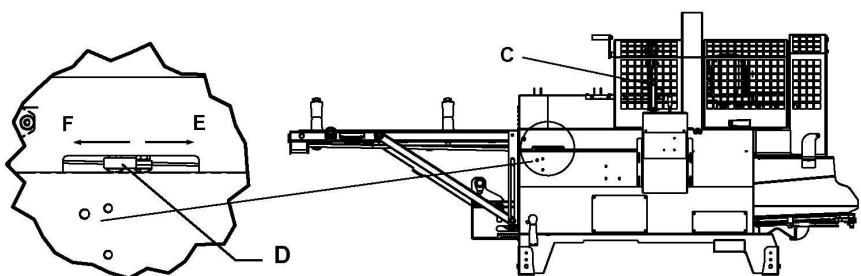

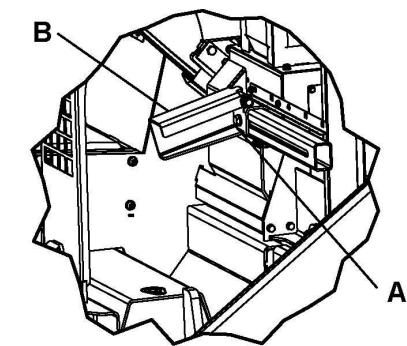

The transporter is prepared for operation by

1. Releasing the strap fixing point and loosening the strap at the points outlined in the illustration.
2. The transporter is put in place by releasing the winch and the wire which holds it in place – the transporter will fold out until it is level with the ground.
3. Afterwards, the transporter is folded out in its full length in the joint E.
4. The transporter is elevated to the required height by means of the winch.

## **Preparation of the feeding conveyor**

The feeding conveyor is folded in place by releasing the locking pin at letter G which locks it. The belt is tensioned by adjusting the screws at letter H. The belt is sufficiently tensioned if it feeds in the wood without friction. Too hard tensioning increases the wear of the belt and reduces the service life considerably.

An indication of what is suitable tensioning is when the belt in the middle of the feeding table, allows for 30-40mm – Re. Illustration 4, letter I.

## **1. Setting of cutting length**

The cutting length is set by releasing the screws at letter **A** and adjusting the rest **B** at desired cutting length.

### **2a. Setting of splitting length from 60 to 40cm**

The adjustment of the splitting length from 60 to 40cm consists of three elements:

1. Make sure that the splitting piston is left in the outer extreme position; i.e. is not retracted. The first step in this operation is to start a splitting movement with the cutting handle C. Afterwards, the handle is moved for forced return by the splitter D quickly forward E and afterwards backwards F). After this procedure, the piston is left in the outer extreme position – i.e. the “protruding length” of the piston must be minimum 200mm.
2. Physical moving of the splitting cradle to the desired splitting length (stroke length splitting cylinder). In order to do this, the locking bolt F is released by a grip. The square hole on the handle for the locking bolt F is employed to rotate the shaft G which, by means of a cogwheel, moved the splitting cradle in or out until it stops in the limit points. After this operation, the locking bolt F is put in place again.
3. Adjustment of the stroke length of the splitting cylinder.  
This is executed by putting the impulse bar in the correct position in letter H. It is important that the operation in section 3 is carried out for all adjustments in order that the machine is to function as prescribed.

Be particularly aware of the fact that the same procedure must be carried out in its entirety for all such adjustments.

### **2b. Setting of splitting length from 40 to 60cm**

The adjustment of the splitting length from 40 to 60 cm consists of two elements:

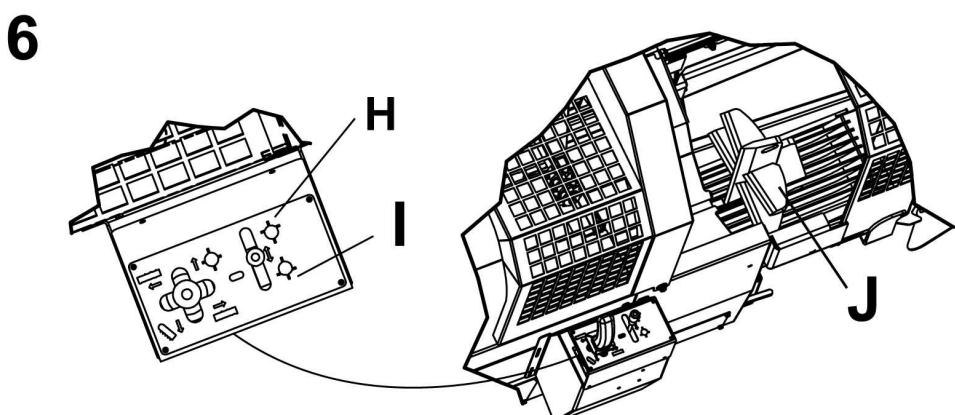

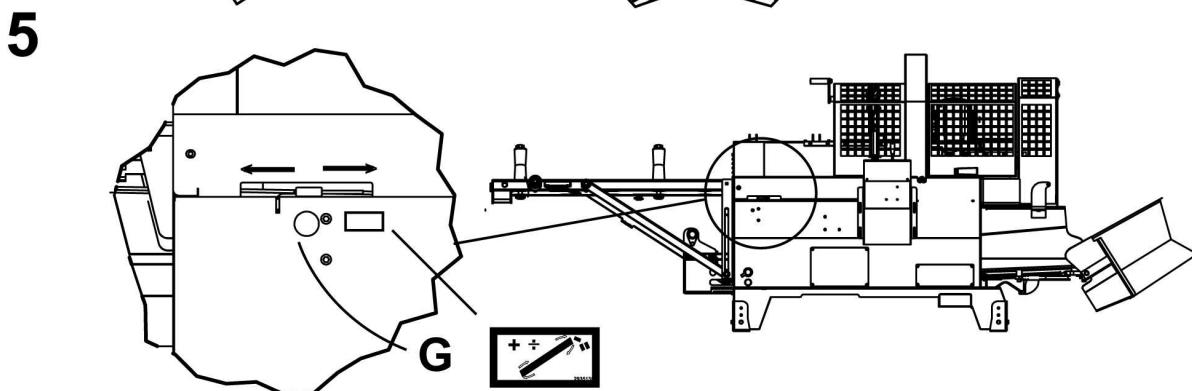

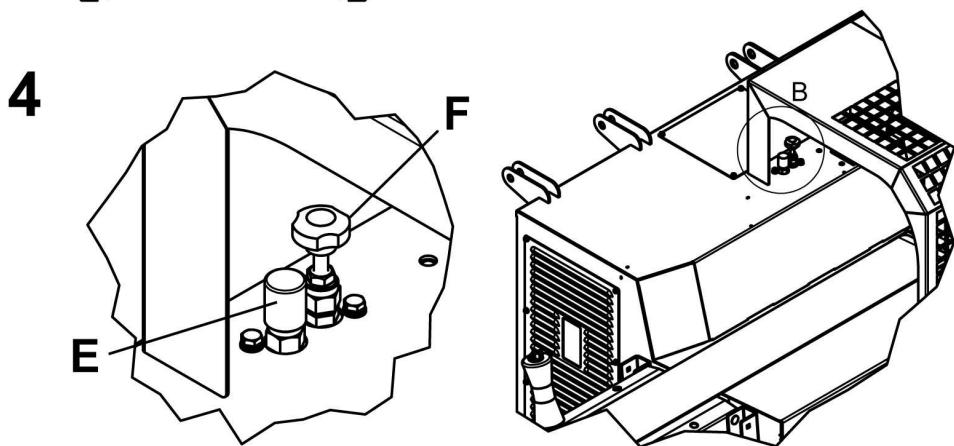

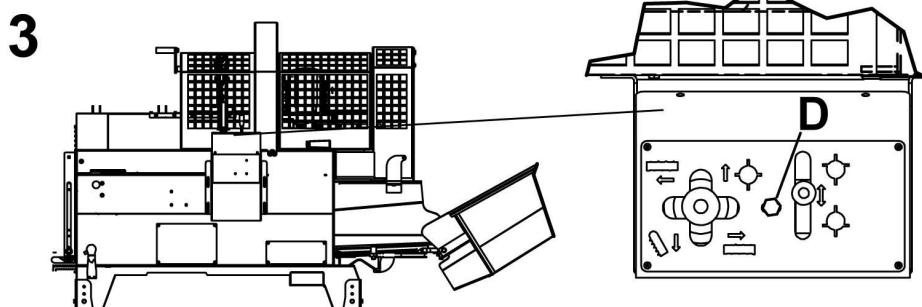

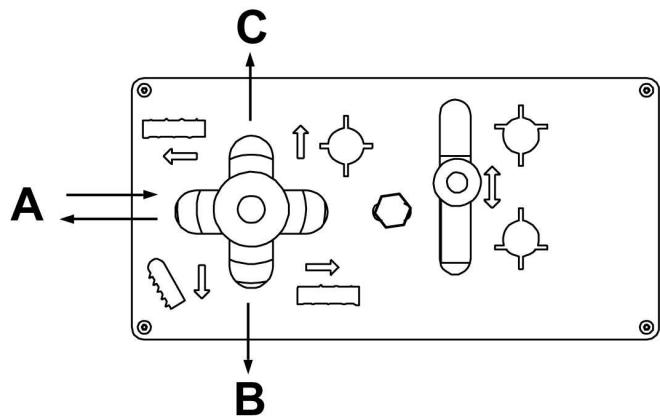

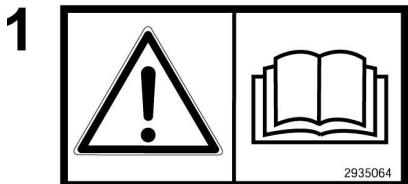

1. Physical moving of the splitting cradle to the desired splitting length (stroke length splitting cylinder). In order to do this, the locking bolt F is released by a grip. The square hole on the handle for the locking bolt F is employed to rotate the shaft G which, by means of a cogwheel, moved the splitting cradle in or out until it stops in the limit points. After this operation, the locking bolt F is put in place again.
2. Adjustment of the stroke length of the splitting cylinder.  
This is executed by putting the impulse bar in the correct position in letter H. It is important that the operation in section 2 is carried out for all adjustments in order that the machine is to function as prescribed.

## **3. Height adjustment of the machine**

In order to be able to elevate the machine in intervals of 40mm up to 80mm, the supporting legs that are fitted in the corners may be set in the required height.

## **4. Temperature - heating**

The machine is to be run to obtain correct temperature before use, i.e. left to idle a few minutes before use.

## **Practical use**

### **1 Condition**

The machine **may not be used** before the operator has done the following:

- Has read the instruction manual and knows how the machine works and how to operate it.
- Has made himself acquainted with and observed the information regarding safety described on pages 8 to 12 in the instruction manual.
- Employs suitable clothing; i.e. hearing protection – protective goggles – protective footwear – work gloves.
- Does not use clothing that may be caught in the moving parts of the machine (for example scarf, wide coats).

**If any faults occur in the functions of the machine during employment, the machines is to not to be used before the defects have been repaired.**

### **2 Start-up and suitable rotating speed – 500 – 540 rpm**

The power take-off of the tractor is connected at low rotating speed and increased slowly to 540 rpm which is the max rotating speed of the pto.

In order that the machine is to work at its optimum, the rotating speed must be between 500 and 540 rpm.

At lower speed, some functions will receive too low oil pressure.

Let the machine run for some minutes before you start the hydraulic functions.

### **3 Main functions – feeding – speed adjustment of the feeding conveyor**

The wood material that is to be cut is fed by means of the feeding conveyor.

The main functions are

- A. To move the feeding conveyor forwards/backwards.
- B. Operate the cutting sword up and down.
- C. Releasing the splitting blow.

It is important that the feeding until the stop is carried out in a moderate speed so that the logs do not bounce back.

In order to adjust the feeding speed, the impact may be adjusted by releasing the screw at letter D and move the impact stopper on the underside to the left.

### **4. Adjustment of cutting**

In order to adjust the cutting function optimally to the wood material, the speed and the pressure of the sword may be adjusted.

The speed of the movement of the sword downwards is adjusted by means of the wheel to left at letter E.

The pressure on the sword is adjusted by means of the wheel at letter F.

As a starting point, the pressure is set at the lowest possible level.

The main rule is that the thicker the wood material, the slower the movement of the sword and the lighter the pressure. Too strong feeding will entail that the engine will not pull the chain and is disconnected by the safety valve.

Too little pressure may cause the chain to jump.

The cutting movement may thus be adjusted to the thickness of the material.

### **5 Speed output conveyor**

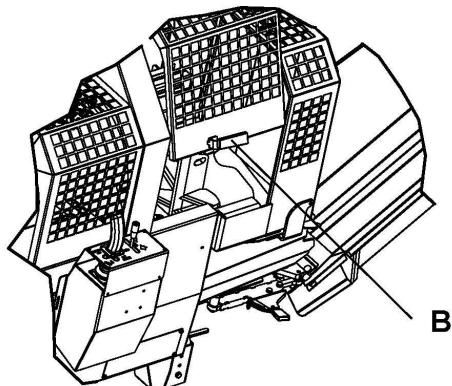

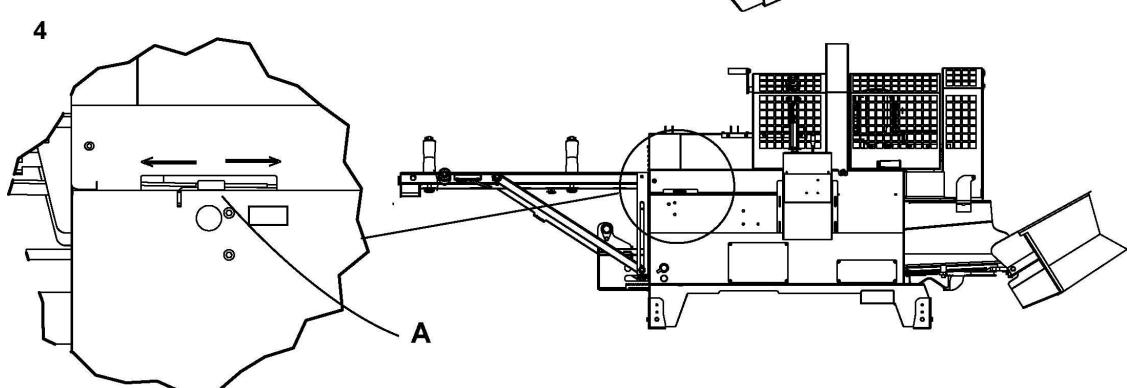

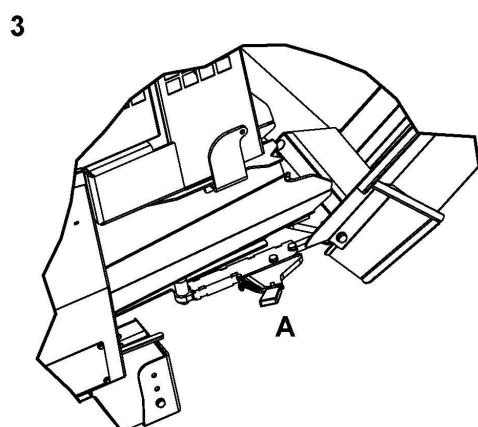

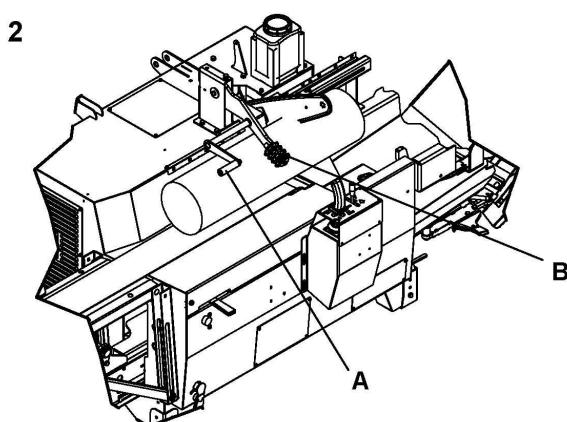

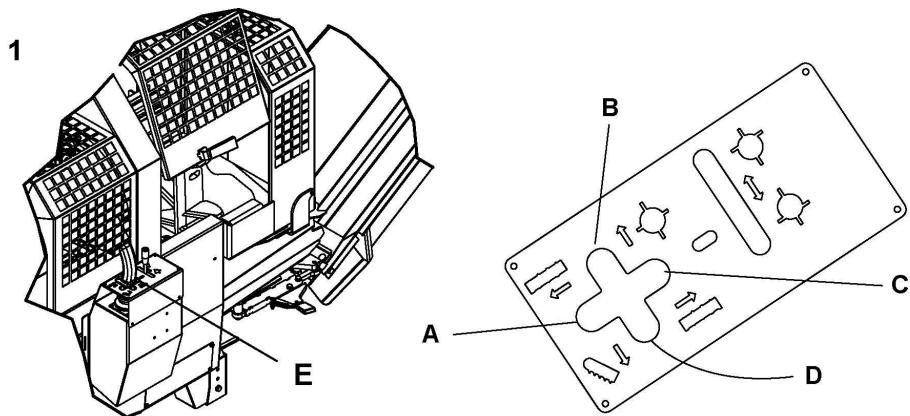

The speed is adjusted with an adjustment wheel fitted on the adjustment block for this at letter G as illustrated.

Select a speed that suits the purpose – depends on the desired throwing length and container to receive the wood.

### **6 Hydraulic knife lift**

The splitting knife H is adjusted up H and down I with the lever equipped for this purpose

In order to change knife J, the lever is moved to the top position (H). In this position, the knife may be lifted out by pressing it forward and lifting it up.

## **1 Cutting**

The lever for operating cutting and operation of the feeding conveyor forwards and backwards (E) has several functions:

The saw chain is hydraulically operated and starts when the lever is moved towards (D).

The lever also releases the splitting function when it is moved towards (B) as illustrated.

### **Thin wood material that is not to be split**

When cutting thin wood materials, you may cut several continuous lengths and let them fall into the splitting cradle without activating the splitting piston. This makes for a far faster cycle.

The splitting function is always released by moving the cutting lever to position B.

## **2 Safety hand operated log holder**

Avoid placing your hands close to the saw chain. This is obtained by using the log holder B and the handle A to operate it.

For cutting the last log of wood, it is important to retain a “suitable” length and cut a shorter piece as the next to last. During this operation, it is especially important to use the hand operated log holder B by means of the handle A so that the user does not receive an unexpected backlash from the final piece.

When you want to cut twiggy or crooked logs, it is important to make sure that these are securely placed. Use the hand operated log holder as much as possible during cutting of such wood materials to prevent that fingers/hands are squeezed.

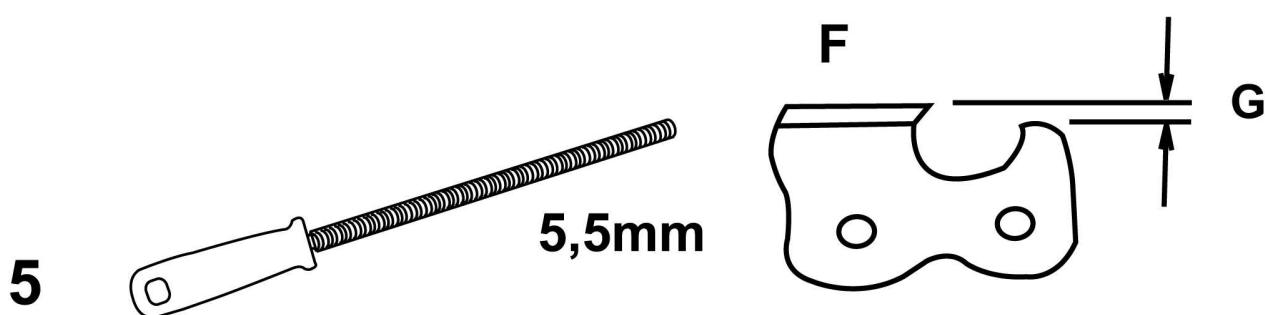

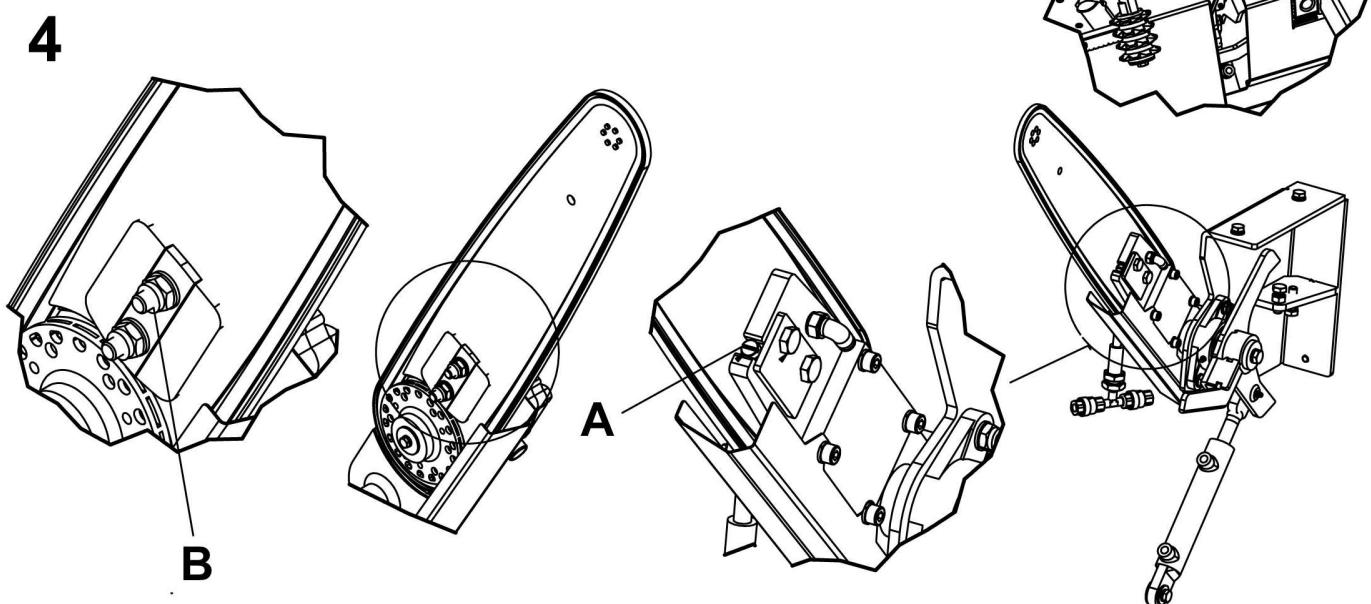

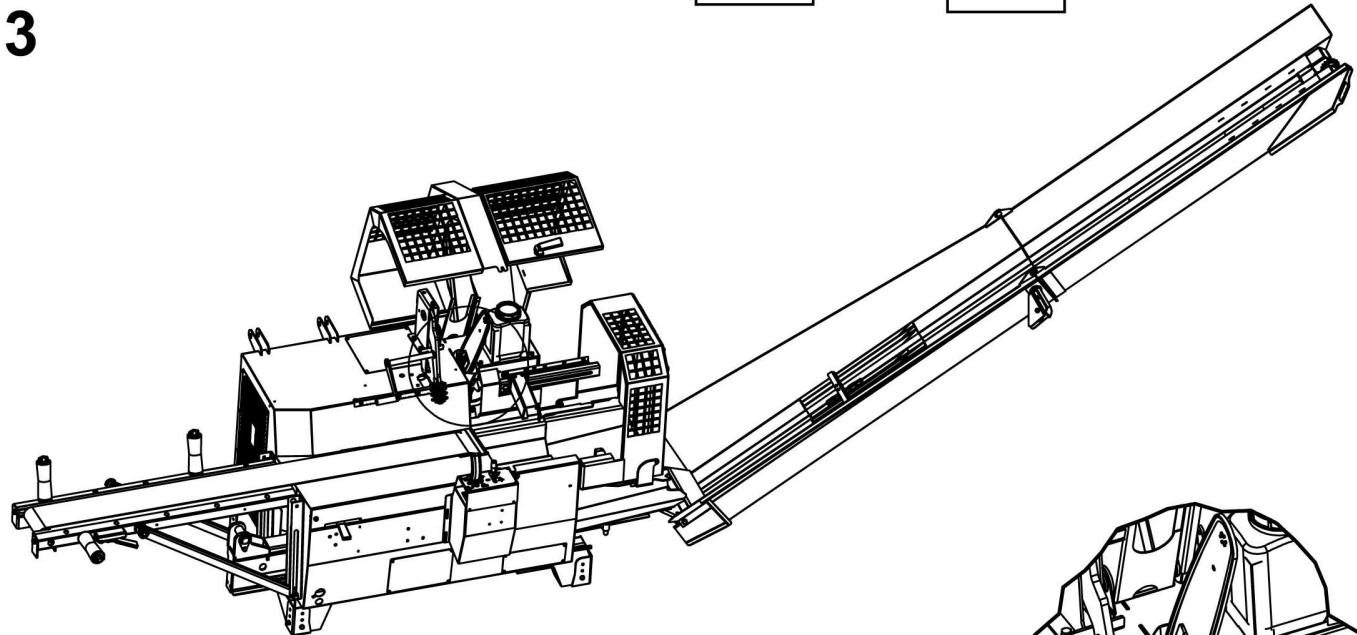

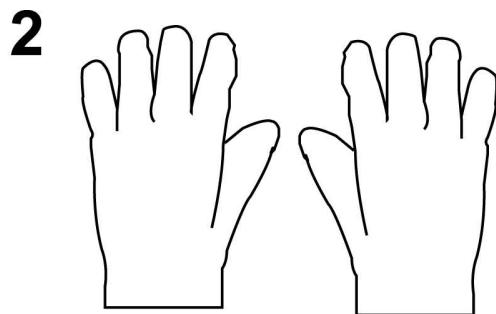

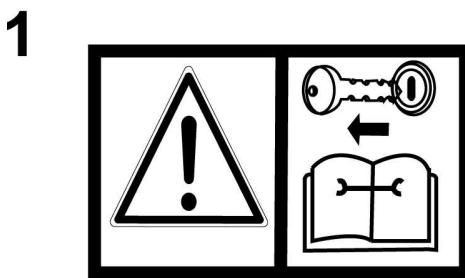

## **3 Sideways adjustment of the transporter**

The transporter may be adjusted in 3 positions to each side; i.e. 7 positions in total. To release the locking, the handle A is activated. The transporter is released and may be moved sideways. The handle A will engage in the first fixing hole (sideways position) when the transporter is moved sideways. If you want to make a sideways adjustment to the extreme outer position, it is recommended to move the transporter sideways to the first stop and then release the handle A to arrive at the next position.

## **4 Jammed wood materials**

If the splitter does not manage to split the wood – the piston is moved backwards by pulling the lever A towards the right.

The log must be removed manually. The safety cover B is opened with the handle for this purpose. This movement closes the machine's hydraulic functions. The log may be introduced again for another attempt.

## **Chain sharpening**

### **General**

Blunt chains and skewly sharpened chains entail great wear on the saw chain sword and risk of extra costs and complications.

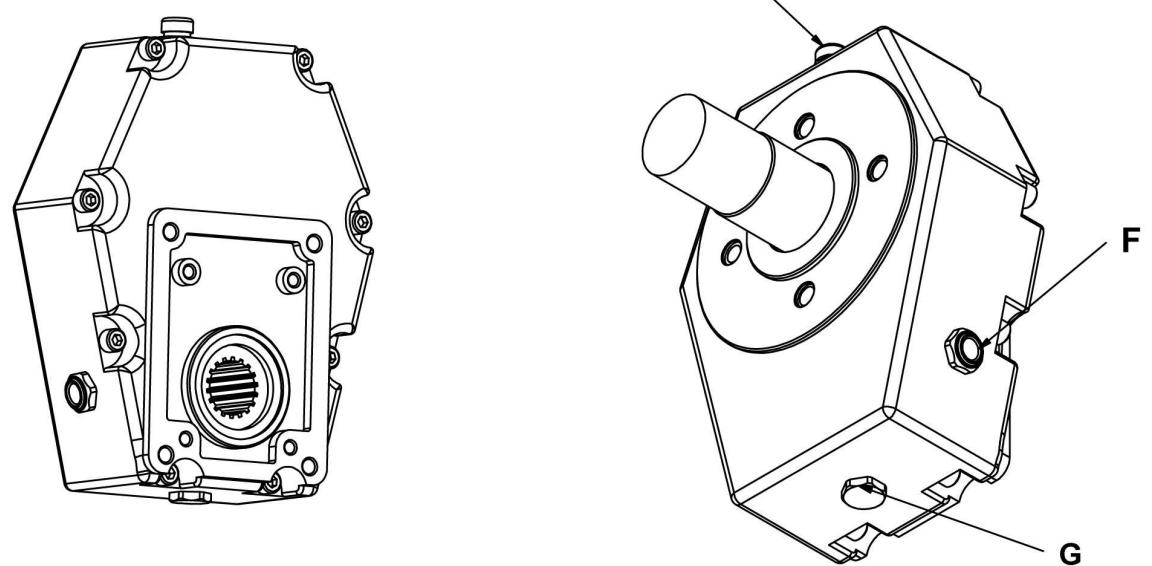

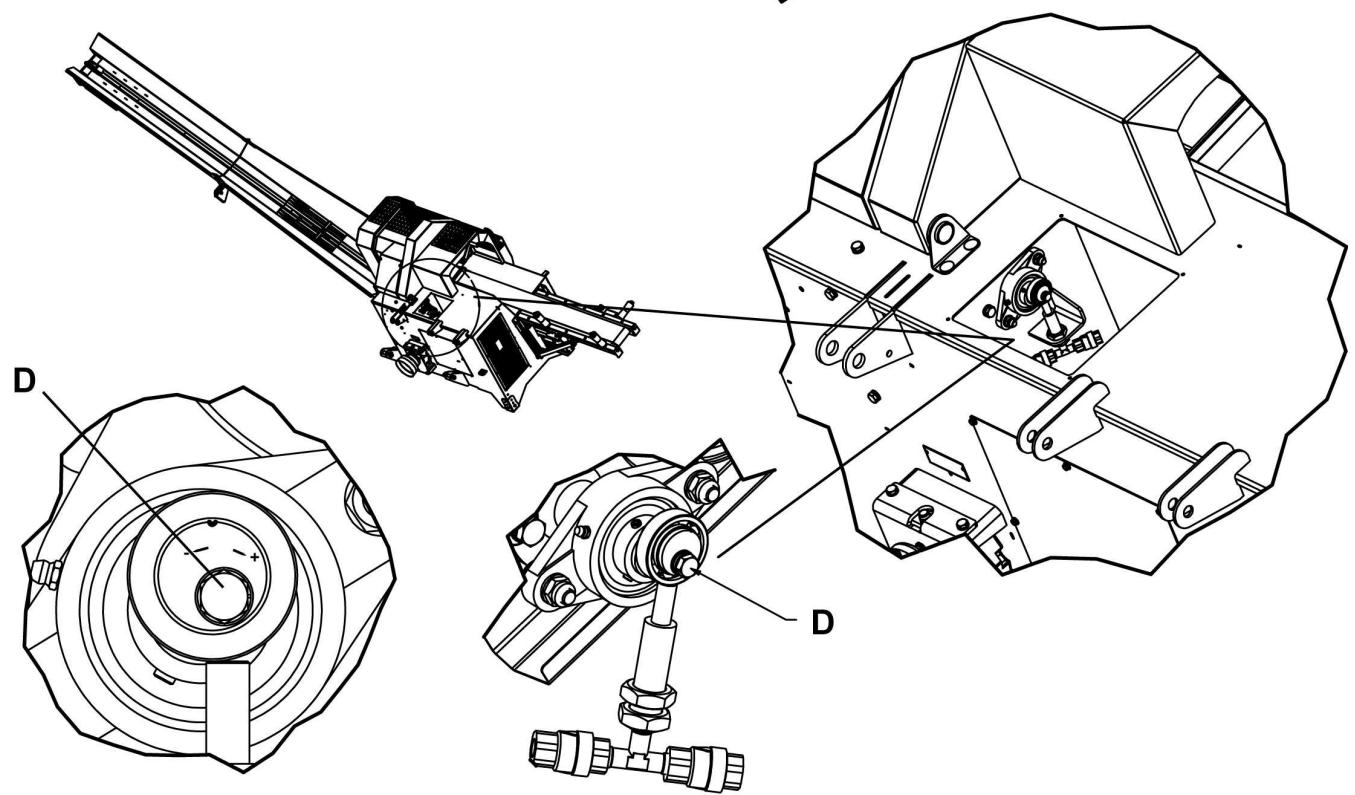

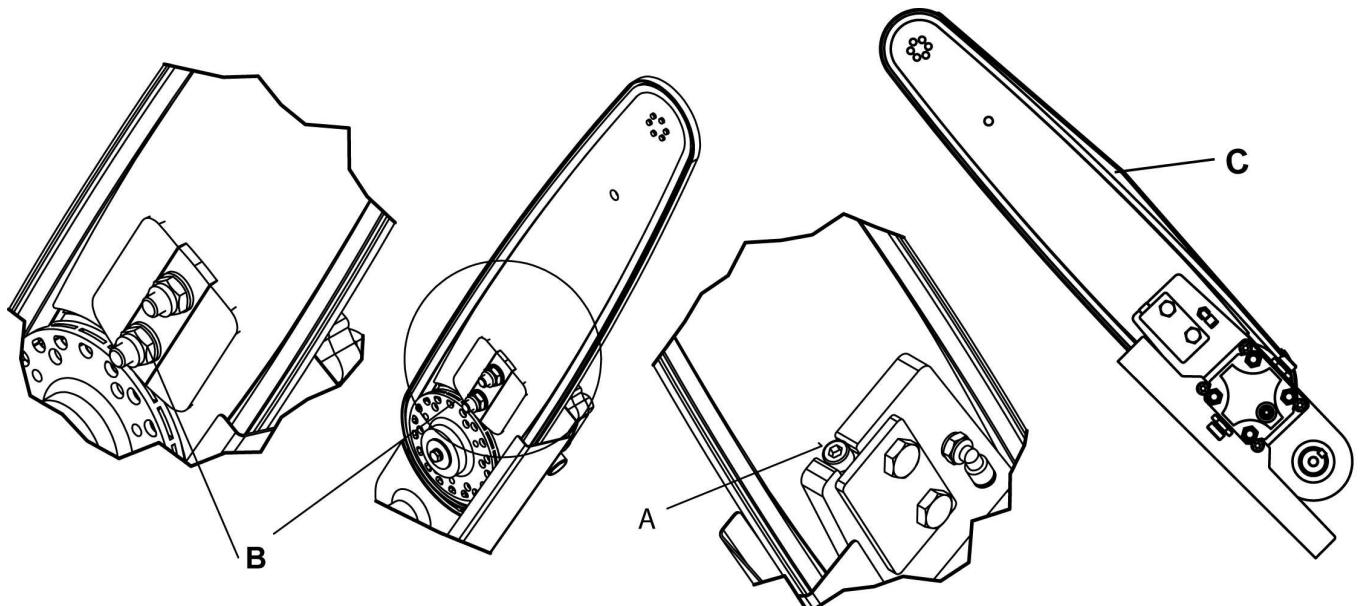

In order to avoid this, Duun VM420 is designed so that the saw chain always must be dismantled from the machine for any sharpening or replacement.

As a starting point, we recommend replacement of the chain or sharpening in equipment designed for this purpose.

Alternatively, the saw chain may be sharpened in accordance with the standard procedure with a file with file gauge for 5.5mm chain and rider gauge. This is to safeguard against faulty sharpening and complications.

1. Before any sharpening work is initiated – stop the machine and tractor and remove the key to ensure unintentional start during the work.
2. Always use work gloves during work with the chain!
3. The covers over the chain proper and the cover over the splitting cradle as sketched
4. To replace the chain, the screw A is released (first release the nuts B) as far so at to allow the chain to be removed in the back for maintenance or replacement.
5. File dimension 5.5mm similar for older chain saws.

The chain is now available for sharpening with a round file from both sides. It is very important to maintain the correct shape of the teeth as illustrated. The main concern is to employ the correct file dimension and make sure you maintain the correct angle of the cutting edge – i.e. 30 – 35 degrees. Figure F shows the correct shape of a sharpened tooth.

# **Chain tensioning and adjustment of the chain lubrication**

## **1 Chain tensioning**

Use gloves during work with the chain!

The chain is tensioned by releasing the two nuts (B). Then screw (A) is tightened to tension the chain proper. Afterwards, the nuts (B) are tightened.

If you prefer to replace the chain, this is done by releasing the screw A (first release the screws B) as far so at to allow the chain to be removed in the back for maintenance or replacement.

Check the chain tensioning by pulling the chain on the middle of the sword C. If you are able to pull the chain 4-5mm up at the edge of the sword, this is considered suitable tensioning. A new chain becomes slackened faster and has to be checked more often.

## **2 Adjustment of the chain lubrication**

The need for chain lubrication may vary with the average thickness of the wood material.

The lubrication is adjusted by releasing the connection (D) and turning the eccentric disk clockwise (+) to increase the lubrication quantity per blow or the opposite (-) to reduce the quantity

## **3 Gearbox**

Recommended oil: Statoil Gearway PS45 75-90 Specification API GL-5 or similar.

The oil volume is 0.35 litres.

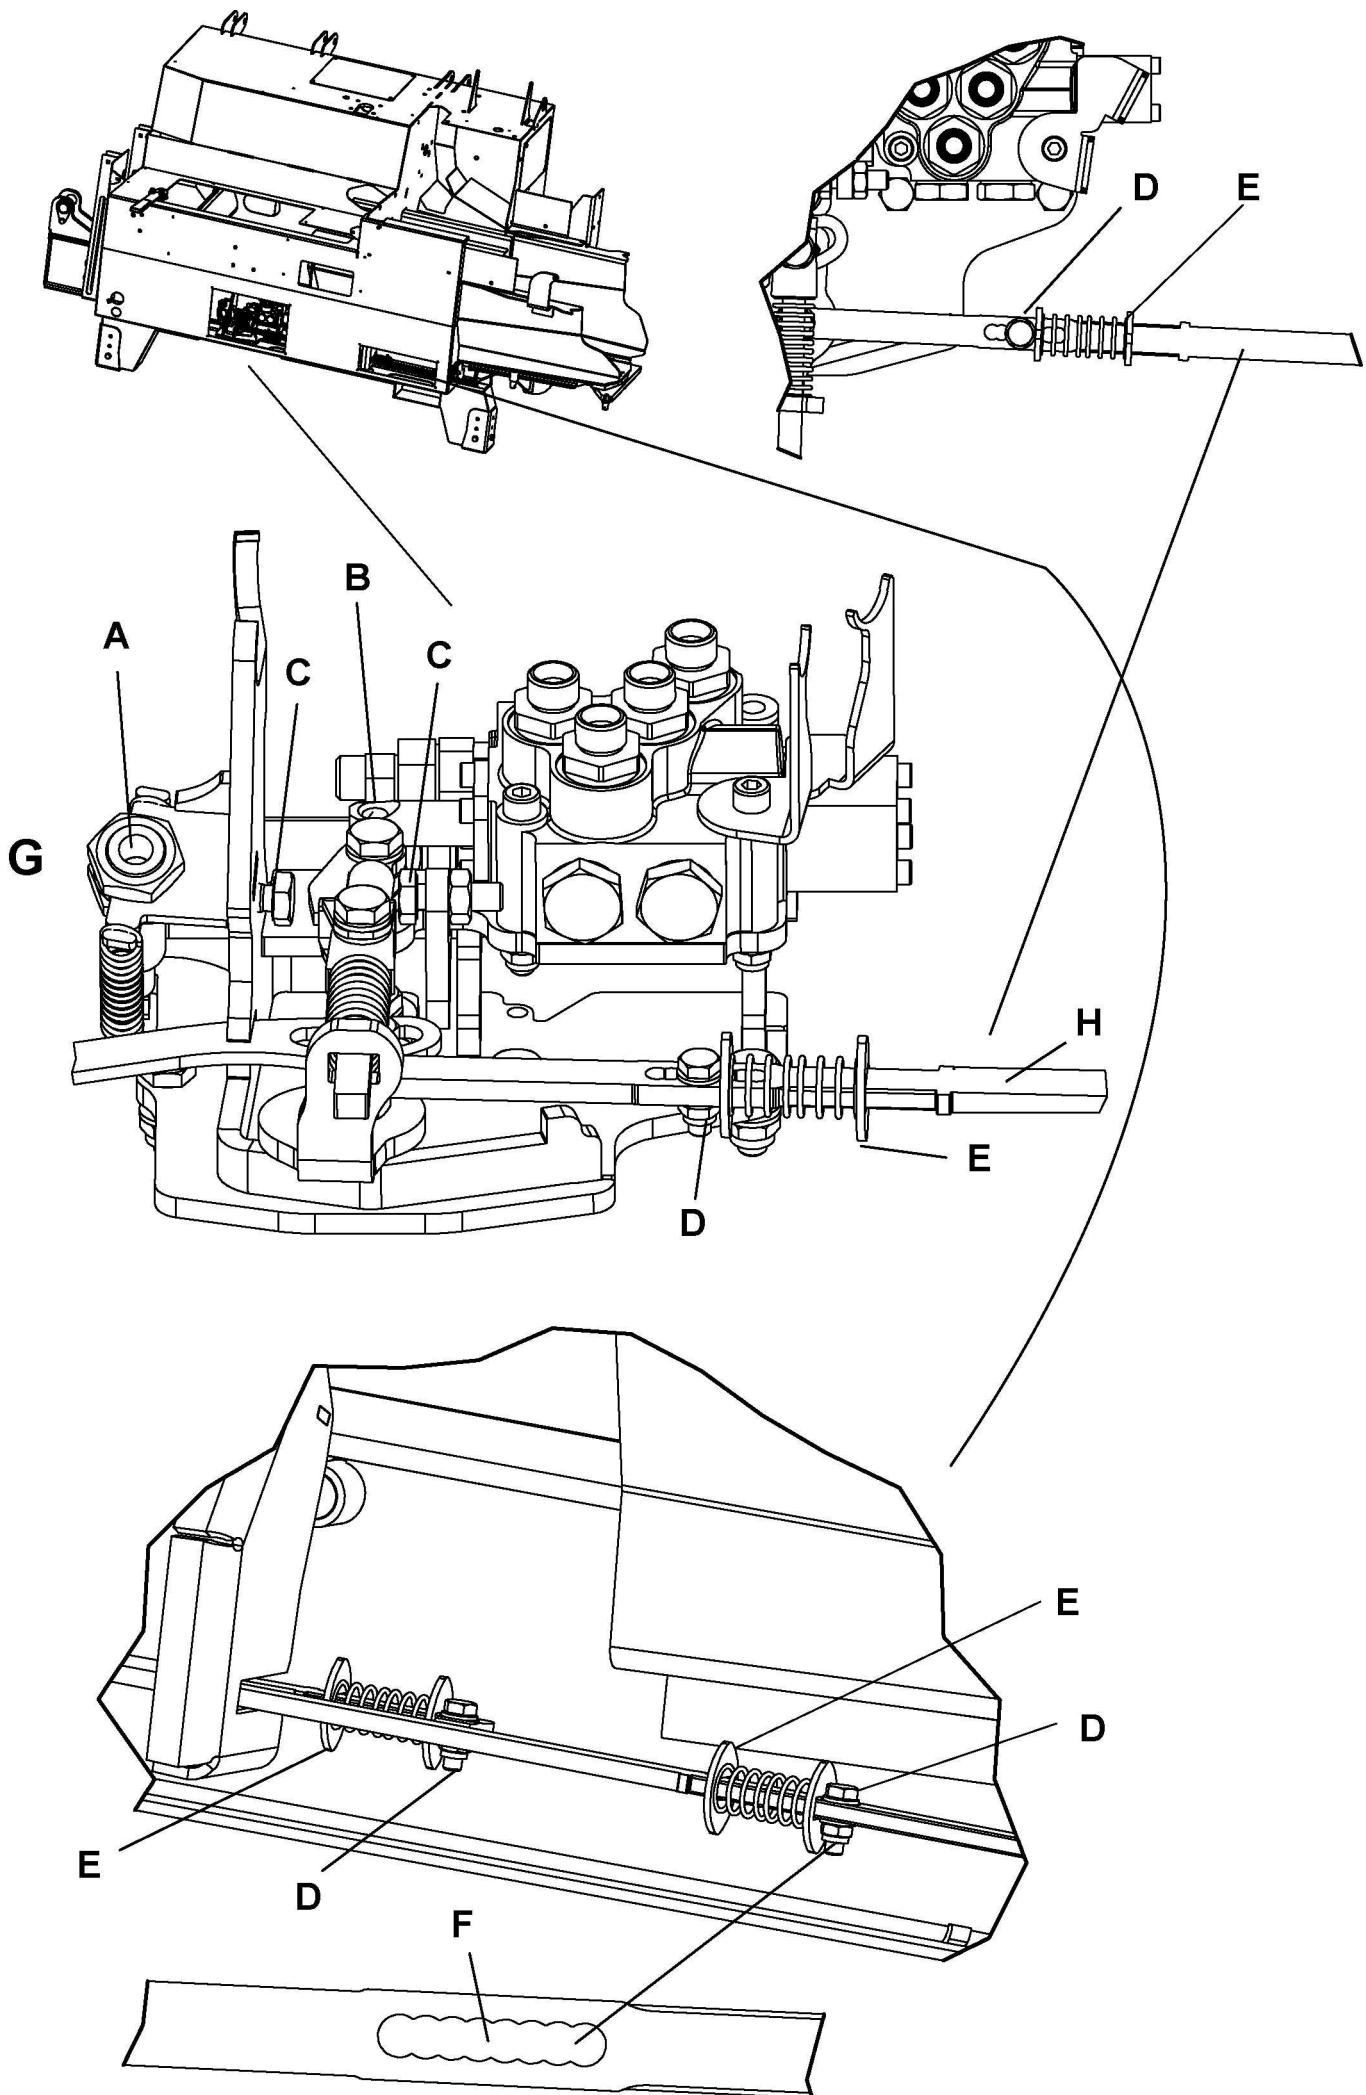

It is very important that the specified oil quality is used particularly with reference to the lubrication effect in below zero temperatures.

Check the oil level after 50 operating hours or after each season by releasing level screw F as illustrated in the sketch (the oil to leak at sufficient level). Topping up via the breathing plug E on the top of the drainage via the plug G. All these are available from the outside of the machine.

Oil change should be carried out every other season or after 500 operating hours (whatever occurs first). Oil change is to be carried out as prescribed with Statoil Gearway PS45 75-90 API GL-5.

**It is very important to fill the correct quantity of oil into the gearbox.**

**Too much oil will lead to higher operating temperatures and risk of breakdown.**

## **Maintenance and adjustment of the mechanism**

The mechanism G is available via the cover as illustrated. Access to the impulse sender from return of the splitter piston is in the opening to the right.

The impulse for activation of the splitter blow comes via the small hydraulic cylinder in A.

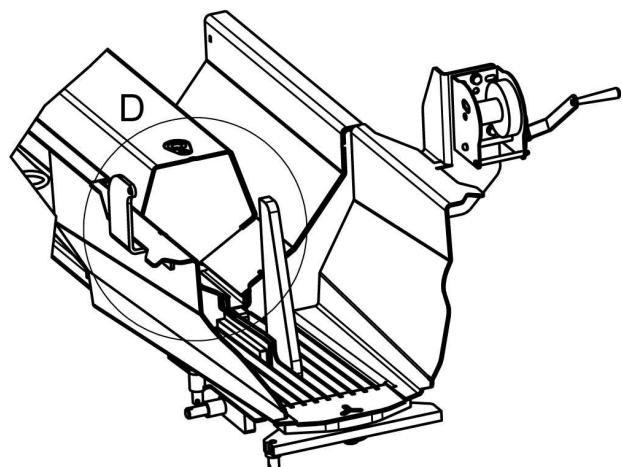

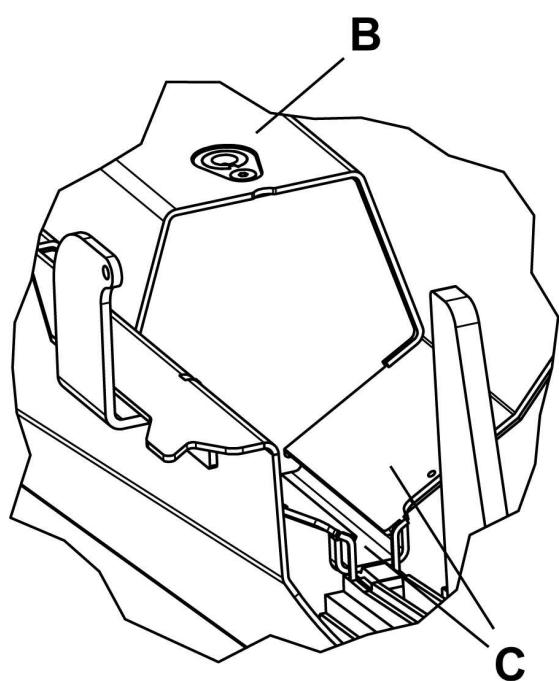

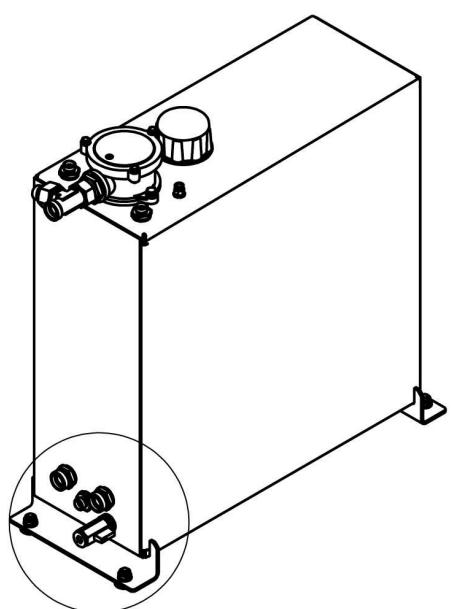

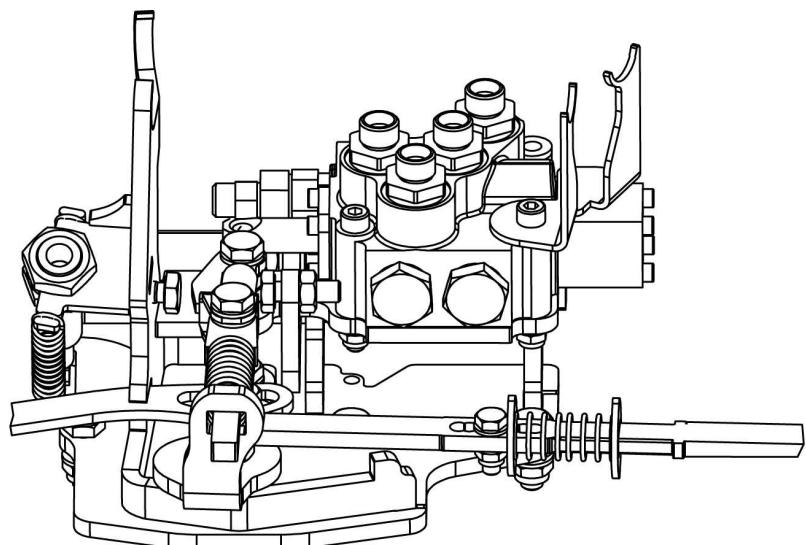

Impulse for return of stop of the splitter piston comes via bar H and the stoppers E. This impulse is transferred to the valve arm B which moves the valve slide mechanically to 3 positions: Tour, return and neutral

The stop signal and the return signal for the splitter piston are produced by contact with the spring loaded discs E. This point of contact may be adjusted by placing the screw D in the groove F.

It is important that the mechanism is kept free from pollution and the gliding surfaces C are lubricated at regular intervals to reduce the wear.

**NB! There are movable parts in the mechanism which involve great power and risk of crushing.**

**The machine should never be operated when the covers are removed.**

## **Lubrication points and maintenance**

VM420 has many bearing points, of which many are only subjected to easy loads and are therefore equipped with pre-lubricated ball-bearings.

**The other bearings are mainly flange bearings that require moderate lubrication. The main rule here is to avoid excessive lubrication and forcing of the oil seals in the bearings.**

### **Mechanism –lubrication, cleaning**

It is an advantage to clean and coat the mechanism with a thin film of oil on the gliding surfaces annually.

This is to reduce the mechanical wear and the risk of malfunctions during operation.

Access to the mechanism is gained by removing pos. 9 pump cover pp.42-43.

The easiest access to the mechanism is straight forward – **in case you work with the machine elevated, it must always be equipped with anti-falling equipment.**

**NB! There are movable parts in the mechanism which involve great power and risk of crushing.**

**The machine should never be operated when the covers are removed.**

### **Hydraulic oil – measures maintenance**

Check of condensation in accordance with the measures described on p.17.

Replace the Filter cartridge (2251065) in the oil filter (1) after the first 50 operating hours and afterwards once a year or after 500 operating hours (depending on whatever occurs first) to ensure max filtration of the oil at all times. Pos. 6 pp.38-39.

Change hydraulic oil after the first 50 operating hours and later every year or after 500 operating hours (whatever occurs first); this is also to secure max oil quality.

### **Bearing points for the splitter cylinder and the gliding surfaces in the grooved for the splitter piston + gliding surfaces**

Interval: Once every day during operation as these are points that are subjected to great strain.

The lubrication point for this is nipple B

The lubrication nipple is directly accessible.

The gliding surfaces are marked C.

# DECLARATION OF CONFORMITY

## Responsible person

**Name:** Roald A. Duun

**Position:** Operation Supervisor

**Company name:** **Duun Industrier as**

**Address:** N-7630 Åsen

Norway

**Tel.:** +47 74 01 59 00

Declares that the following machine: **Wood machine VM420**

Manufacturer: **Duun Industrier as**

Type **Duun Wood Machine VM420**

Serial no.: .....

Manufacturing year: **2012**

## Is in conformity with:
